1.1 INTRODUCTION

Raising children, especially for new parents, is a multifaceted challenge that requires balancing numerous responsibilities. Among these, ensuring proper nutrition is one of the most critical tasks, as it plays a foundational role in a child's physical and mental development. According to the Cambridge Dictionary, children are defined as boys or girls from birth until they reach adulthood. This definition underlines the fact that during this formative period, children require special attention to meet their developmental needs. Proper nutrition is a cornerstone of growth, and parents often find themselves navigating the complexities of deciding what to feed their children. Nutritional requirements are not only age-dependent but also influenced by factors such as gender and activity levels. These needs increase as children grow, making it essential for parents to stay informed and adaptable in their approach to meal planning.

Children's nutritional needs are diverse, encompassing a variety of essential nutrients necessary for growth, energy, and overall health. These nutrients fall into seven key groups: carbohydrates, proteins, fibres, fats, minerals, vitamins, and water. Among these, water is particularly vital, serving as a solvent for metabolic reactions that sustain life. The balance of these nutrients is crucial, as deficiencies or excesses can lead to health issues. For instance, inadequate intake of vitamins and minerals can hinder development, while excessive consumption of unhealthy fats or sugars can contribute to childhood obesity. Understanding these dietary needs and incorporating them into everyday meals can be overwhelming for parents, especially those dealing with the demands of a busy lifestyle or the challenges of raising picky eaters.

This is where a specialized web application can make a significant difference. Designed as a resource for new parents, the application provides a comprehensive platform to

promote good eating habits in children from a young age. Its core feature is a collection of nutritious and delicious recipes tailored to meet the dietary needs of growing children. By offering a wide variety of meal options, the application not only simplifies meal preparation but also introduces parents to creative ways of incorporating essential nutrients into their child's diet. This innovation ensures that meals are not only balanced but also appetizing, catering to children's tastes and encouraging them to explore new flavors.

Beyond meal preparation, the application serves as a support system for parents struggling to manage the challenges of feeding finicky eaters. It provides tips and strategies to make meals more appealing and enjoyable for children. The broader objective of the application is to foster a positive relationship with food in children, helping them develop lifelong healthy habits. By encouraging children to try different foods and flavours, it aims to break the cycle of repetitive or unhealthy eating patterns.

In addition to its focus on children's health, the application also addresses the needs of busy parents. By streamlining the process of meal planning and preparation, it reduces the stress associated with ensuring a balanced diet for children. This enables parents to dedicate more time and energy to other aspects of parenting. Ultimately, the application is a tool that combines practicality with education, equipping parents with the knowledge and resources they need to navigate the complexities of childhood nutrition effectively.

1.2 OBJECTIVE

The first objective of this project is to analyse user requirements. We can collect important information by using surveys to ask mothers about their favourite types of food. These surveys will help us understand what they need and how we can make things easier for them. For example, we can ask questions about what types of meals they like to cook. By gathering this information, this will help us create new ideas and solutions that can make preparing meals faster, simpler, and more enjoyable for them. In addition to surveys, we can also learn a lot by observing how users interact with the web application. For example, we can see which recipes users view most often, how long they spend on each recipe. This information can tell us what we can improve our recipe suggestions. This will make our web application more helpful and keep users coming back to find more interesting recipes that suit their tastes. Lastly, we can add a feature to the web application that allows users to easily share their feedback about their experience. This feature can be

simple, like a form where users can write about any problems they face while using the web application or cooking the recipes. With this feedback, we can understand the difficulties users encounter and make necessary changes to improve their overall experience. By listening to what users have to say, we can fix issues, add better features, and make the web application more user-friendly, especially for busy mothers. The second objective of this project is to develop the intuitive interface of the web application Little Love Recipe. We need to design a user-friendly web application that is easy to navigate and use, especially for moms who may not have a lot of time to search for recipes. The layout of the web application should be simple, with clear categories and buttons, so users can quickly find what they are looking for without feeling confused. Having a clean and well-organized design will make the web application more enjoyable to use and help moms save time when searching for recipes that suit their needs. To make the web application even more helpful, we can add a search and filter function for recipes. This feature would allow moms to search for recipes based on meal types, like breakfast, lunch, or dinner, and filter results based on ingredients they have at home. For example, if moms need to prepare meals in lunch for their kids, the web application could recommend recipes in lunch. This way, moms can quickly find recipes that match their kid's preferences and dietary requirements, making meal preparation faster and more convenient. In addition, we should include extra features such as nutritional information. Nutritional information is important, as it helps moms ensure the meals, they prepare are healthy and suitable for their children. This way, they can make informed choices balancing taste with nutritional value. By this feature, we can create a web application that is not only easy to use but also beneficial for moms looking to prepare healthy and delicious meals for their kids.

1.3 SCOPE

The scope of Little Love Recipe encompasses a comprehensive suite of features and functionalities designed to assist parents in discovering, sharing, and managing halal and healthy recipes for children. At its core, the application provides robust user management, enabling users to register, log in, manage profiles, and customize their experience. Features like saving favorite recipes, tracking activity history, and tailored content ensure a personalized and engaging platform. Recipe management is the heart of the application, allowing users to upload, update, classify, and delete recipes. Each

recipe is enriched with detailed instructions, images, videos, and nutritional information, making meal preparation easier and more informative. To enhance accessibility, advanced search and filtering options enable users to quickly find recipes based on keywords, ingredients, or categories. These features are complemented by community interaction tools, such as reviews, ratings, forums, and comment sections, fostering a sense of collaboration and shared learning among parents. Social sharing functionalities further extend the platform's reach, encouraging broader engagement. The application also integrates advanced features like privacy and security, ensuring user data is protected, and analytics and reporting, which monitor user activity to optimize content and improve the platform. By analyzing popular recipes and user preferences, the platform evolves to meet the community's needs more effectively. Additionally, performance enhancements, such as fast loading times and responsive design, ensure a seamless user experience across all devices. Tailored for parents seeking halal and healthy meal options for their children, Little Love Recipe combines practical tools with a supportive community to simplify meal planning while promoting lifelong healthy eating habits. Its long-term vision includes expanding features like personalized meal plans and smart kitchen integrations, making it a trusted and indispensable resource for modern families.

1.4 SIGNIFICANCE OF DEVELOPING THE WEB APPLICATION PROJECT

The development of the "A Little Love Recipe" web application is highly significant as it provides a comprehensive solution to the challenges faced by busy parents in preparing wholesome and halal meals for their children. The platform is designed with a user-friendly and engaging interface that simplifies meal planning and encourages frequent use. Features like account registration via email, Google, or Facebook make accessing the platform easy, while advanced search and filtering options allow users to quickly find recipes based on ingredients, keywords, or meal types. Organized navigation into categories such as "Breakkie Snacks," "Quick-Lunch," and "Easy Dinner" ensures parents can efficiently locate meals suited to their children's needs.

The application prioritizes simplicity and functionality through a minimalist design, large and legible fonts, and well-structured content, allowing users to access recipes without

unnecessary distractions. Parents can save favourite recipes, track their history, and customize their experience, creating a platform that caters specifically to their preferences. Moreover, the ability to create, edit, and remove recipes empowers users to be innovative and creative, enabling them to craft personalized meals for their children.

Beyond functionality, the platform fosters a sense of community by allowing users to share reviews, ratings, and comments, creating a space for exchanging tips, advice, and inspiration. With robust privacy measures and quick loading times, the web application provides a secure, reliable, and seamless experience for its users.

By addressing real-world challenges, "A Little Love Recipe" supports parents in promoting healthy eating habits and fostering positive mealtime experiences for their children. The platform serves as more than just a recipe repository—it is a valuable tool that simplifies daily life, inspires creativity, and builds a supportive community for parents navigating the complexities of modern family life.

2.1 TECHNICAL DETAILS & REQUIREMENTS OF THE WEB APPLICATION

2.1.1 USER REQUIREMENTS

i. Homepage

- Users should be able to view a list of trending recipes.
- Users should use a search bar to find recipes quickly.

ii. Recipe Browsing

- Users should be able to browse through categories (breakfast, lunch, dinner)
- Users should see a short explanation, photo and preparation time for recipes on that list.

iii. Recipe Details

- Users should be able to click on a recipe to view its details such as:
 - Ingredients list
 - Cooking instructions
 - Estimated preparation and cooking time
 - Reviews
 - Serving size

iv. User Interaction

- Users able to review the recipes by leaving rating or comments on recipes

v. User accounts

- Users are able to register and log in to save their favorite recipes.
- Users can edit their name, photo and bio on their profile.

vi. Recipe Submission

- User should be able to post their own recipe including photo and description.
- User also able to delete the recipes they submitted.

2.1.2 SYSTEM REQUIREMENTS

Functional Requirements

- i. Homepage
 - The system should display a list of elements such as create recipe, my recipe, search recipe, my profile and shopping list that is fetched from the database.
 - A search bar that allows users to search recipes by name, keywords or ingredients.
- ii. Recipe browsing
 - The system should categorize recipes into predefined groups such as breakfast, lunch, dinner.
 - Each recipe in the list should include:
 - A short description.
 - A photo.
 - Estimated preparation time.
- iii. Recipe details
 - The system should provide a detailed view for recipes, including:
 - A list of ingredients.
 - Step-by-step cooking instructions.
 - Estimated preparation and cooking time.
 - Reviews and rating submitted by other users.
 - Serving size information.
- iv. User interaction
 - Registered users should be able to:
 - Leave ratings for recipes.
 - Add comments on recipes for feedback or questions.
 - The system should display aggregate ratings for each recipe.
- v. User accounts
 - The system should allow users to:
 - Register with a unique username and password.
 - Log in and log out securely.
 - Edit profile details including name, picture and bio.
 - Save recipes as “Favorites” for easy access.
- vi. Recipe submission

- Registered users should be able to:
 - Submit new recipes including a photo, description and detailed instructions.
 - Edit or delete recipes they previously submitted.

Non-functional Requirements

i. Performance

- The website should load in less than 3 seconds for any page under normal traffic.
- The search functionality should return results in less than 1 second.

ii. Usability

- The interface should be designed to be user-friendly with large buttons and simple navigation.
- The system should ensure a consistent layout and reachability across all devices.

iii. Security

- Implement HTTPS to encrypt data in transit.
- Secure user authentication with hashed passwords.
- Validate and sanitize all user inputs to prevent SQL injection and XSS attacks.

iv. Scalability

- The backend should handle up to 1000 concurrent users without significant performance degradation.
- The system should support the addition of new recipe categories in the future.

v. Compatibility

- The website must be responsive and work seamlessly on desktop, tablets and mobile.
- The website should be compatible with major browsers.

2.1.3 HARDWARE-SOFTWARE REQUIREMENT

Hardware Requirements

i. Development Environment (Local Development)

- - Processor: Dual-core CPU (Intel Core i3 or AMD equivalent)
- - RAM : 4GB
- - Storage: 10GB free HDD space for project files and local server tools
- - Display: 1280x720 resolution or higher

ii. Server Hosting Environment

- - Processor: 2 CPU cores
- - RAM: 2GB
- - Storage: 20GB SSD
- Iii. Client Devices
- - Devices like desktops, tablets and smartphones with modern web browsers

Software requirements

i. Frontend

- HTML5: For structuring the web pages.
- CSS3: For styling web pages, ensuring visually appealing design.
- JavaScript: For interactivity, handling user reviews, ratings and dynamic recipe searches.

ii. Backend

- PHP: For handling server-side operations, user authentication and database interaction.
- Database Management System: MySQL for storing user accounts, recipes, reviews and other data.

iii. Web server

- Apache: A widely used open-source web server.

iv. Development tools

- Local development environment:
 - XAMPP for running PHP and MySQL locally.
- IDE/Code editor:
 - Visual Studio Code, PHPStorm for writing and debugging code.

v. Testing tools

- Browser developer:
 - For debugging HTML, CSS and JavaScript.

2.1.4 PROGRAMMING LANGUAGE

i. Frontend

- HTML5: For structuring the content and layout of the website.
- CSS3: For styling the website, ensuring its visually appealing and responsive.
- JavaScript: For adding interactivity.

ii. Backend

- PHP: For server-side scripting to handle user authentication and data manipulation.

2.1.5 DATABASES

i. MySQL

- Relational database for storing structured data like:
- User accounts (username, email, password, profile details)
- Recipe details (title, ingredients, instructions, photo)
- User interactions (ratings, comments, favorites)

2.2 PROJECT OVERVIEW

i. A kid recipe website that offers an engaging platform for users to explore, share, and save recipes. It is designed with a user-friendly interface, emphasizing simplicity, accessibility, and interactivity.

ii. Key features:

- User registration
- Recipe browsing, submission, reviews
- Personalized user experience

2.3 SELECTION OF TOOL & JUSTIFICATION

- i. Frontend tools: Tailwind CSS
- ii. Backend tools: PHP
- iii. Local development: XAMPP

Justification

- i. PHP and MySQL
 - Suit with dynamic web applications with CRUD (Create, Read, Update, Delete) operations.
 - Easy to integrate and PHP accessible for developers.
- ii. HTML5, CSS3, JavaScript
 - Technologies for interactive and responsive web design, simple to use.
- iii. Tailwind CSS
 - Reduce development time, ensure consistency along the project.
- iv. XAMPP
 - Suits for beginners and experienced developers, solution for development and testing.

2.4 ROLES & RESPONSIBILITIES OF EACH TEAM MEMBERS.

Name	Web Development Tasks	Report Responsibilities
1. Nur Rahmah Binti Mhd. Khirudin	• myrecipe.php: Develops and manages the user's recipe page where users can add, edit, and view their saved recipes. • favourite.php: Implements functionality to mark recipes as favorites and view them later. • recipe.php: Designs and codes the general recipe page that displays all recipes. • admin.php: Develops the admin panel for managing user accounts, recipes, and overall application settings. • landing page	✓ Conclusion: Responsible for summarizing the key outcomes of the project, future recommendations, and final remarks.
2. Sabreena Hany Binti Sariman	• categories.php: Develops the page for browsing recipes by category, enabling users to filter recipes based on specific types. • search.php: Implements the search functionality for the application, allowing users to look up recipes by keywords. • about.html: Creates the "About" page, providing information about the purpose, team, and vision of the web app. • contactus.html: Design the "Contact Us" page, including forms for users to send inquiries or feedback to the team.	✓ Methodology: Documents the flowcharts, interfaces, and approaches used in the development of the web application.
3. Siti Nur Esya Binti Buwang	• logout.php: Codes the logout functionality to ensure users can securely log out of their accounts. • check_login.php: Implements backend logic for user authentication, verifying login credentials and managing sessions.	✓ Technical Details and Requirements: Documents the technical specifications, system architecture, and required software/hardware for the project.
4. Hajidah Binti Azizi	• Profilepage.php: Creates the user profile page where users can view and edit their personal information. • editprofile.php and editprofile.html: Develops the functionality for users to update their profile details.	✓ Introduction: Write the introduction for the report. ✓ Objective: Defines the objectives of the web application. ✓ Problem and Scope: Identifies the problem being solved by the application and describes the project's scope and limitations.

3.1 FLOW CHARTS-EACH MODULES/FUNCTION

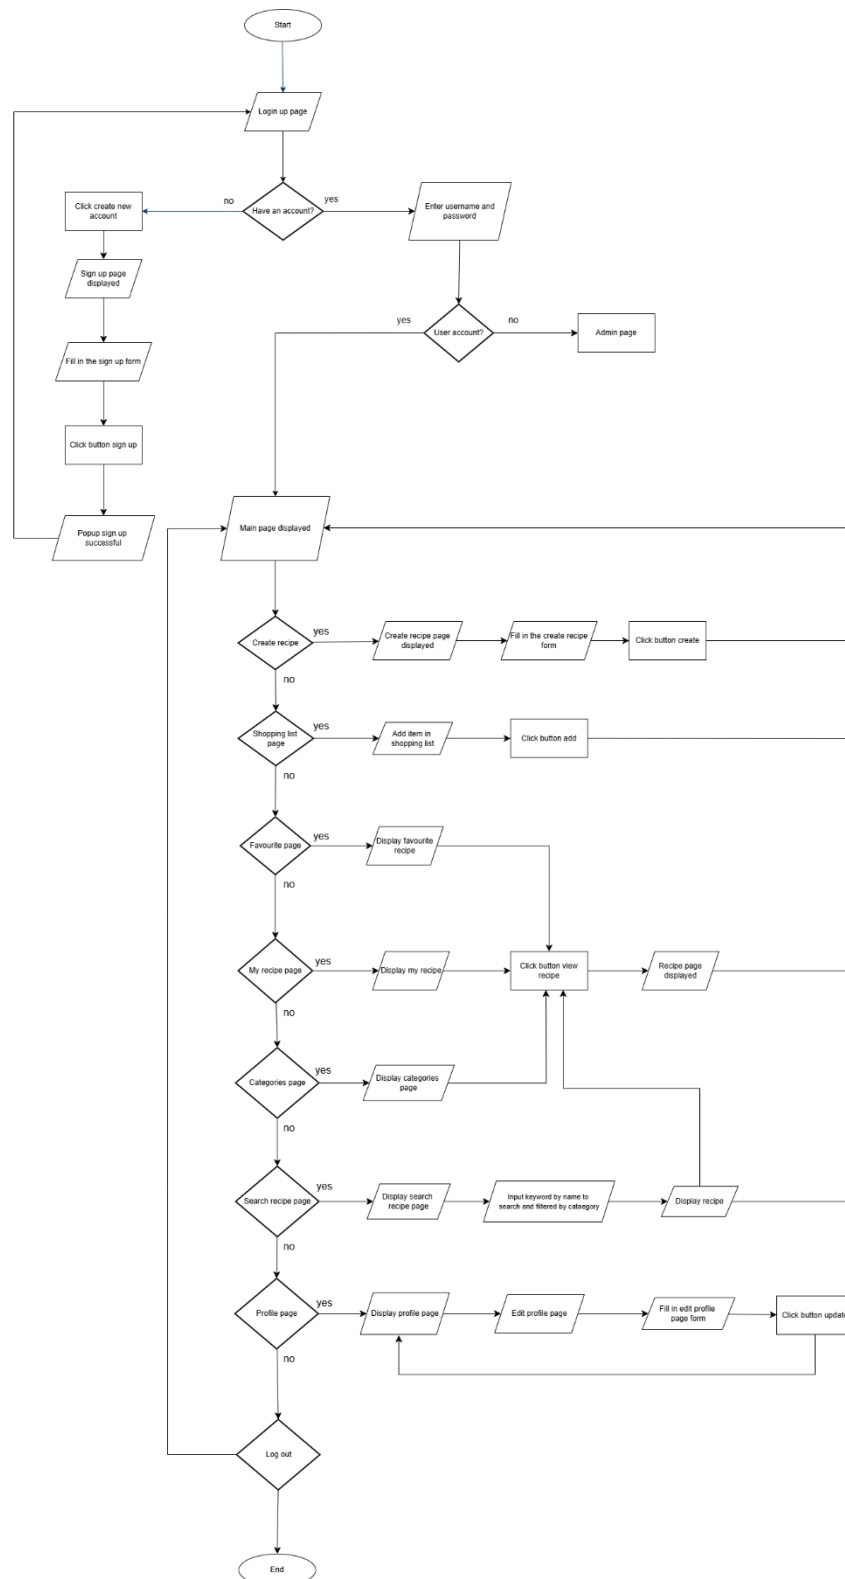

figure 3.1 Flowchart

3.2 NAVIGATION/HYPertext MODELLING AND PRESENTATION MODELLING

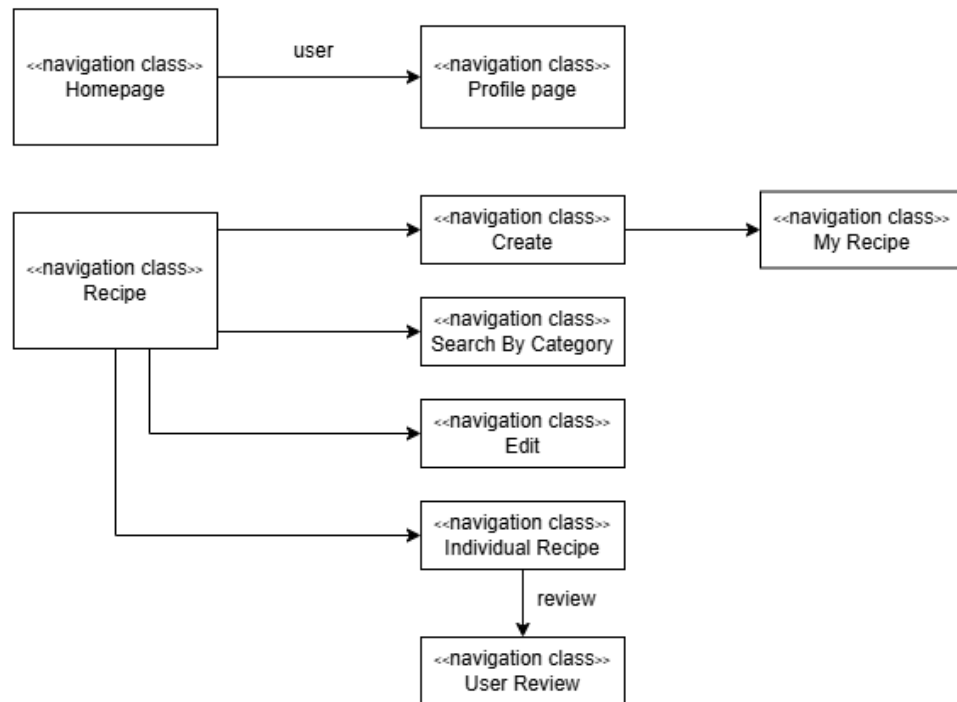

figure 3.2.1 Hypertext Navigation Modelling of Web-based Applications

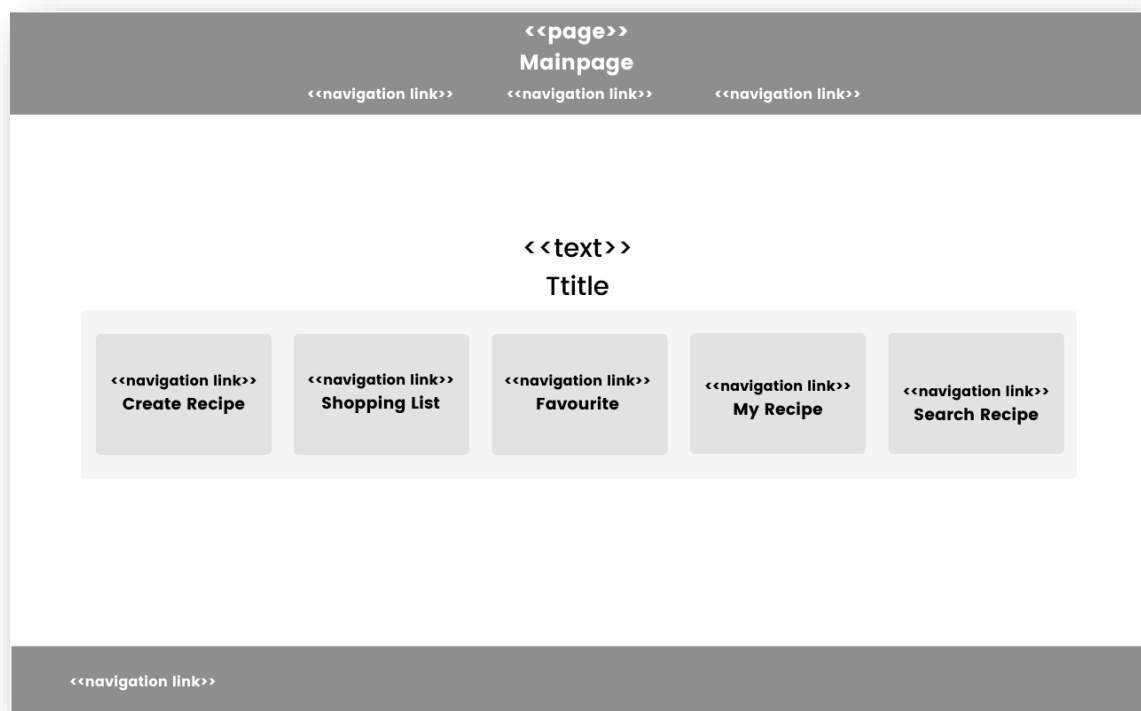

figure 3.2.2 Homepage Presentation Modelling

3.3 EXPLANATION OF FUNCTIONALITIES/MODULES WITH ITS SCREENSHOT INTERFACES

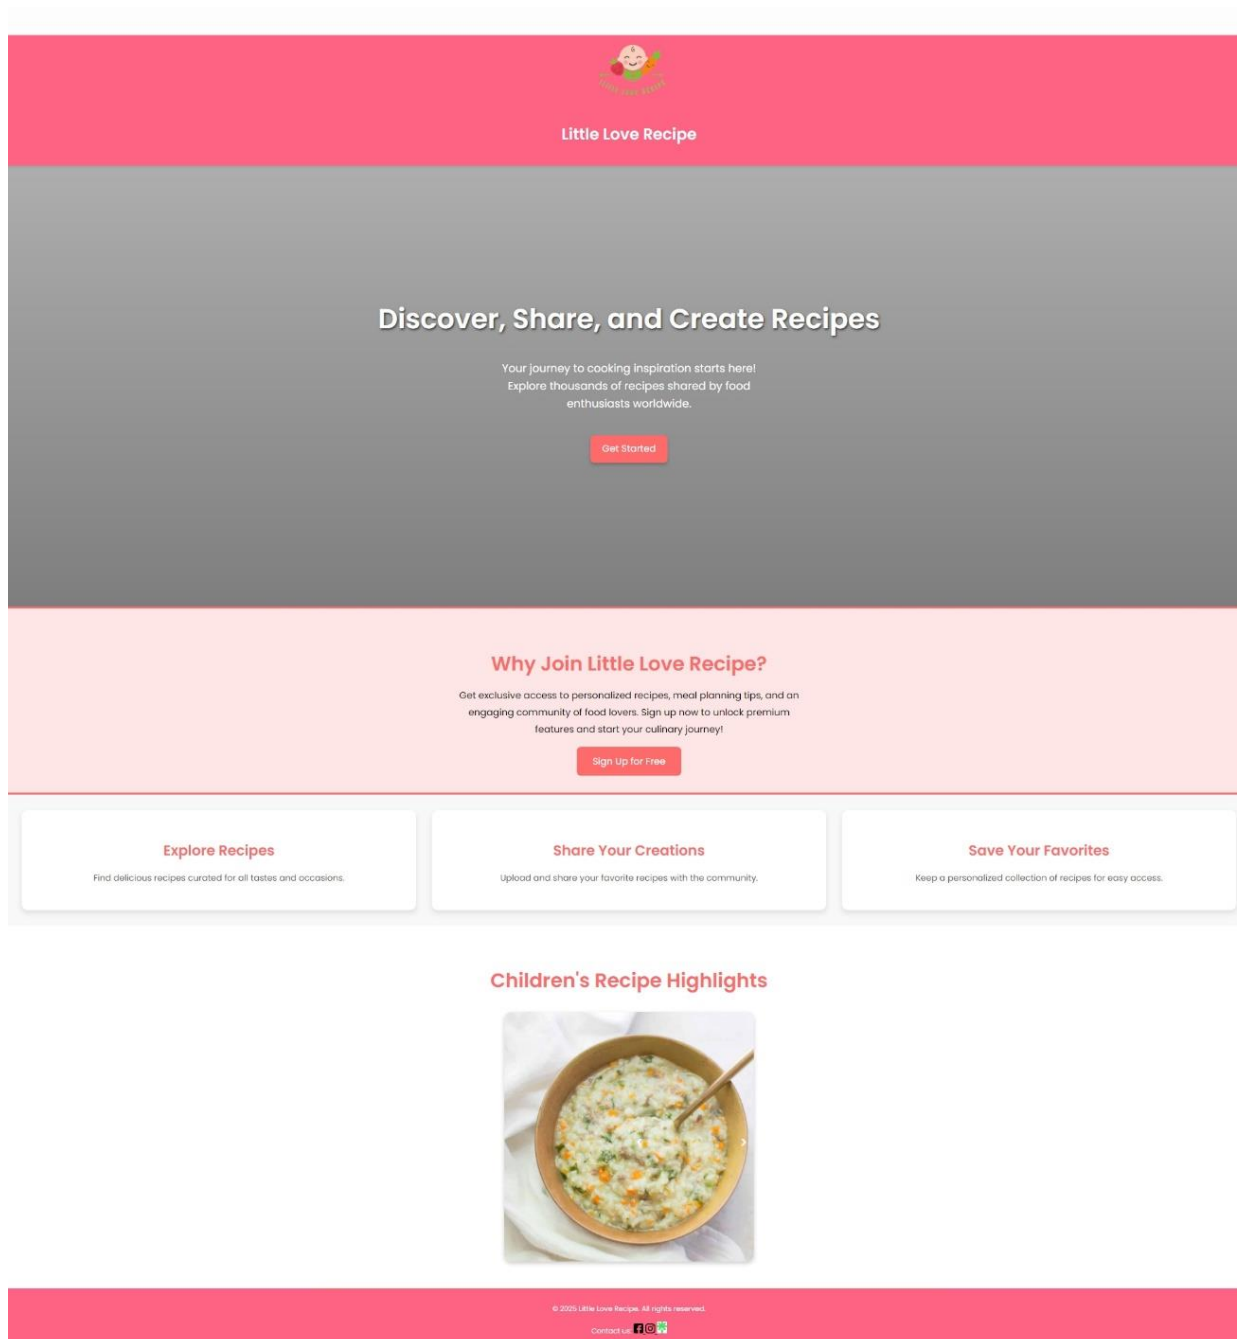

figure 3.3.0 Landing Page

For this project, we integrate a landing page, Linktree, and social media platforms as our main e-marketing strategies to invite users to discover, share, and create recipes in a community of food enthusiasts. This page contains three parts. On top of the first part is a logo and the name of the web-based application namely Little Love Recipe. Also, we

encourage users to join the platform by revealing some premium features and benefits of why users should join Little Love Recipe. With a feature of a call-to-action (CTA) “Sign-up for free” button, this page aims to encourage users to have a glimpse of what the platform offers. Next, this web-based application is focused on kid and family-friendly recipes which could attract parents by highlighting children’s recipes at the bottom of the landing page. Lastly, the footer consists of the three main e-marketing strategies to help the user reach us through social media and Linktree if they have any inquiries.

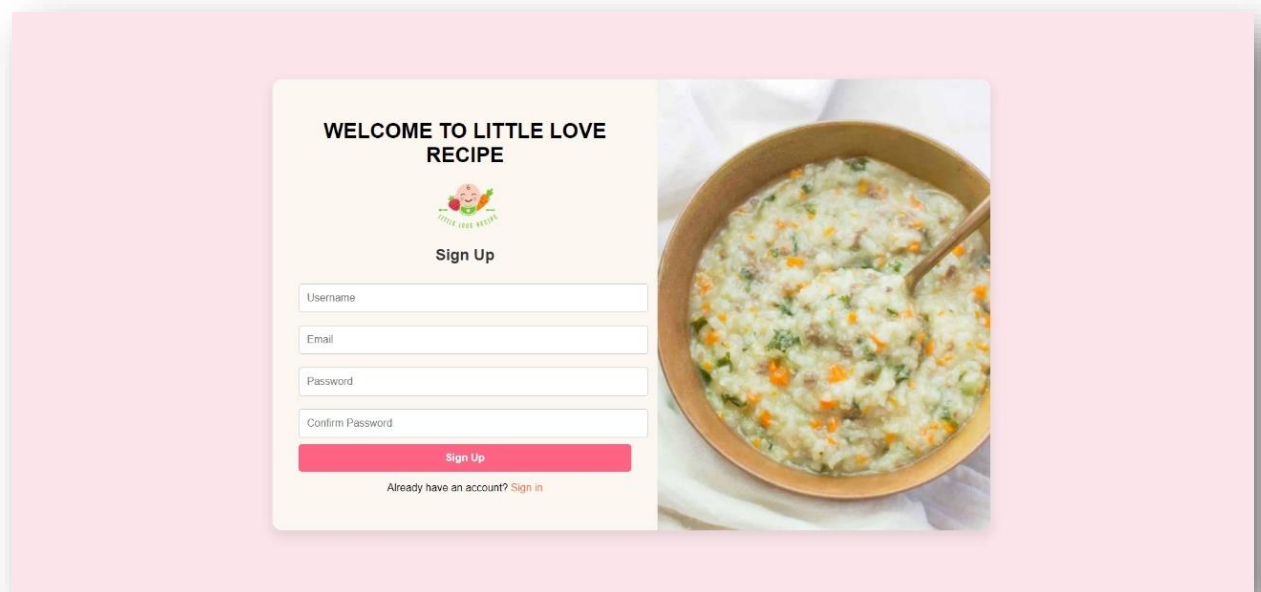

figure 3.3.1 Sign-up page

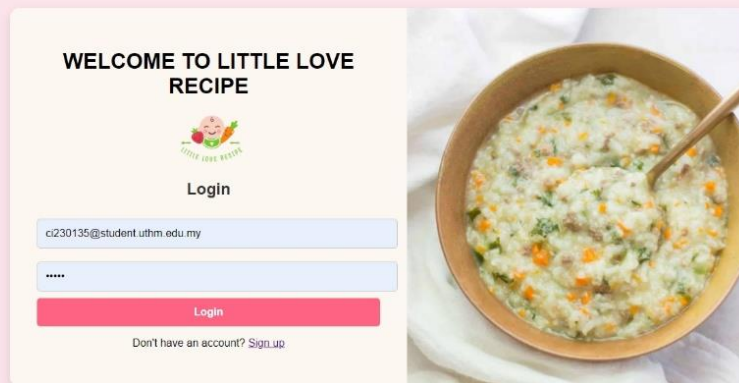

figure 3.3.2 Login page

Once the user clicks on the “Get Started” or “Sign up Now” button from the landing page, the web-based application will be directed to the Sign-up page. First-time users are required to register their username, email address, and password. To secure the data that the user has input, the user needs to confirm the password once again to complete the sign-up registration page. If the user already has an account, the user can simply click on the Sign-in button at the bottom right corner of the page. After the complete registration, the user can click the log-in or sign-up button to connect to the home page.

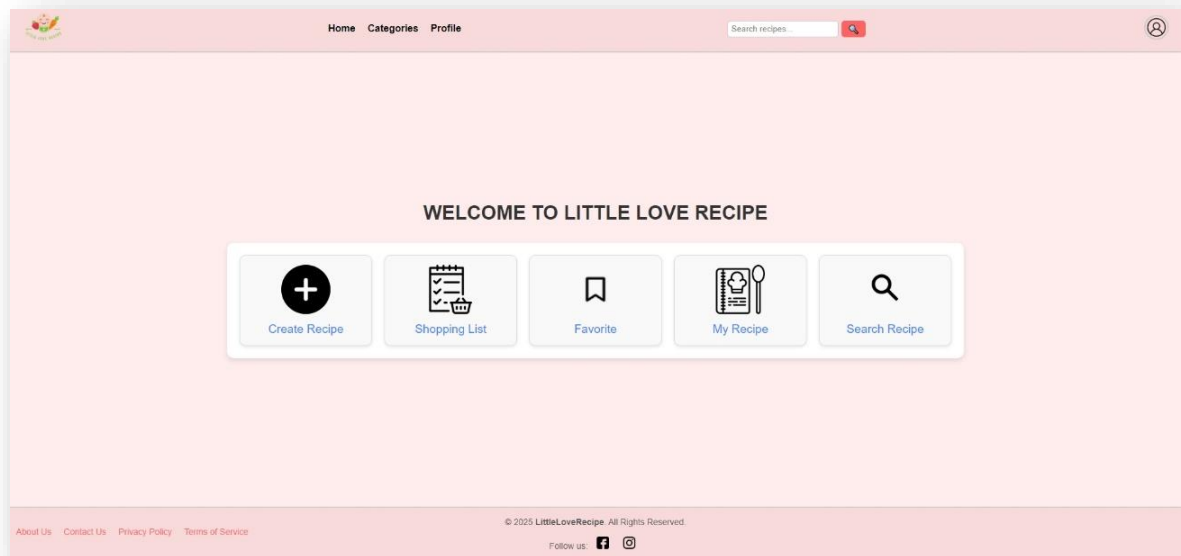

figure 3.3.3 Main page

At the center of the home page contains a list of some features in the box container with a warm welcome to the web-based application on top of it. The list of features includes create a recipe, a shopping list, favourite, my recipe, and search recipes. Furthermore, the header of the homepage displays a logo, a few navigation bars of home, categories, a profile, a search bar, and a profile icon that allows two functions viewing the profile and logging out. Meanwhile, the footer displays navigation of About Us, Contact Us, and some icons of social media that will direct to each platform which is Facebook and Instagram. The header and footer are applied to all pages of the website.

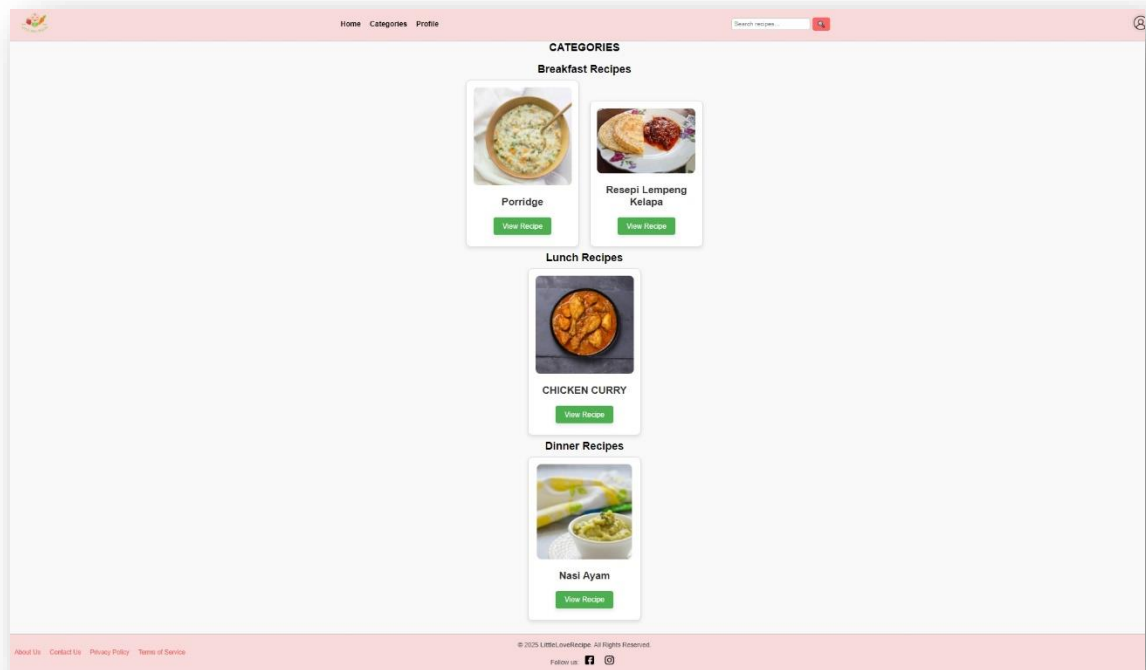

Figure 3.3.4 Categories page

The categories page displays all recipes that have been categorized into breakfast, lunch, and dinner. On top of the recipes have been categorized as above to differentiate the recipes that are suitable for which meal type to convenient for the user to choose. Each recipe container consists of the image and the name of the recipe. The users are able to view the recipe further by clicking on the view recipe button.

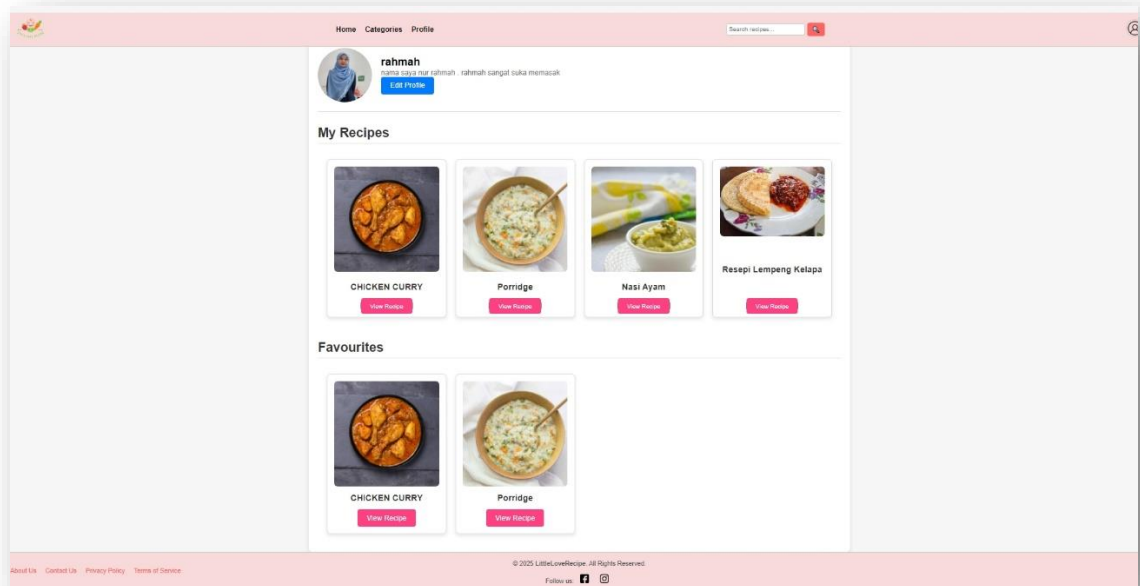

figure 3.3.5 Profile page

The profile page consists of the image, the username, and the bio of the user. The user can click the edit profile button to customize their own profile at any time they want. Moreover, this page also displays the recipes that have been created by the user and any recipes that have been added to the favourite.

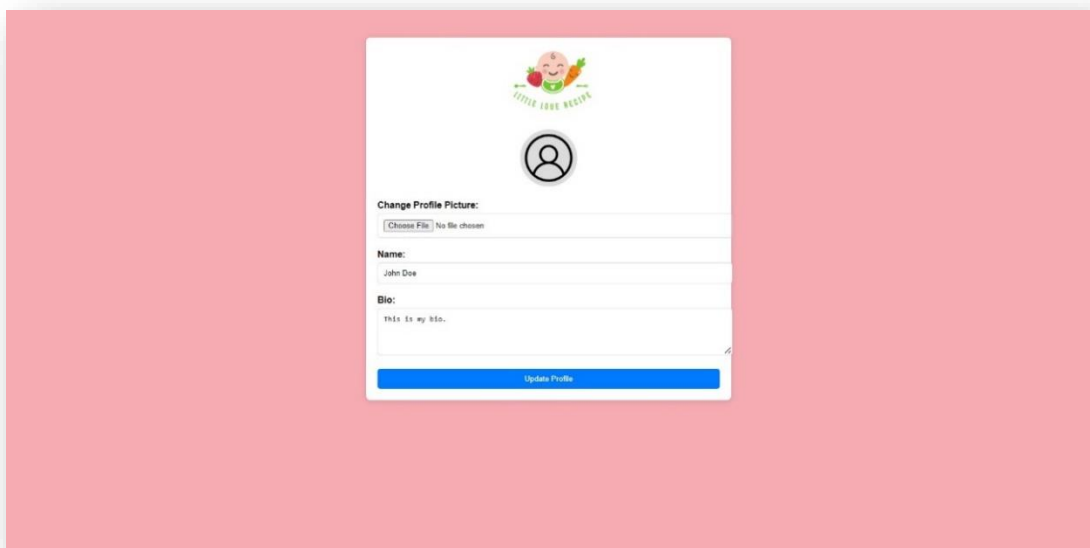

figure 3.3.6 Edit profile page

If the user tends to customize their profile, they will be directed to the edit profile page as above. On this page, the user can choose a profile picture by clicking the choose file button, and the picture will appear underneath the logo. The user can edit the name and the bio by filling in the form. To ensure the page is updated, the user should click the update profile button.

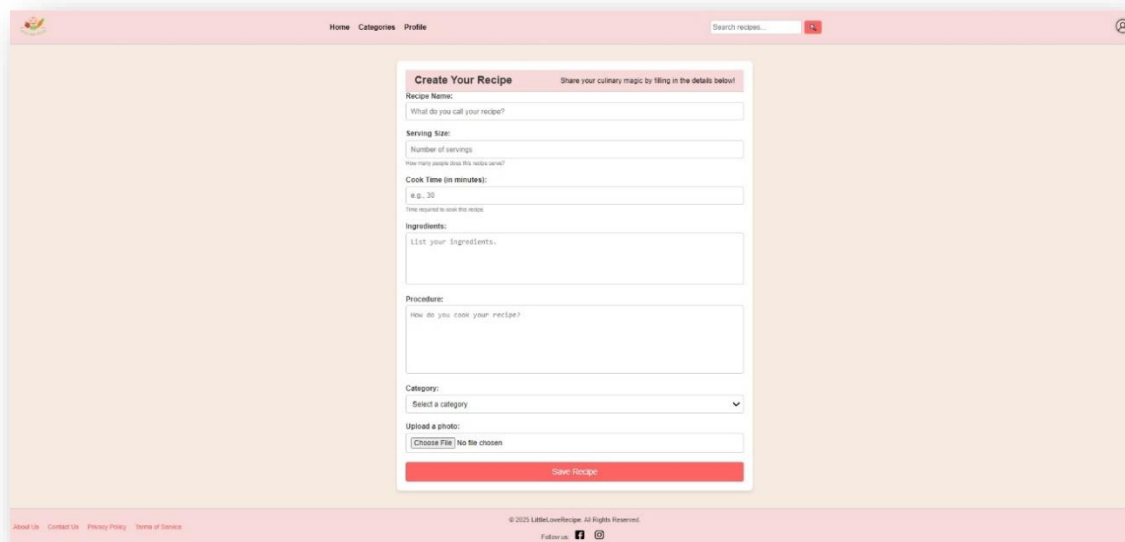

The image shows a web browser window displaying a 'Create Your Recipe' form. The form is titled 'Create Your Recipe' with a subtitle 'Share your culinary magic by filling in the details below!'. It contains several input fields: 'Recipe Name:' with a placeholder 'What do you call your recipe?', 'Serving Size:' with a placeholder 'Number of servings' and a subtext 'How many people does this recipe serve?', 'Cook Time (in minutes):' with a placeholder 'e.g., 30' and a subtext 'How long will it take to cook this recipe', 'Ingredients:' with a placeholder 'List your ingredients.', and 'Procedure:' with a placeholder 'How do you cook your recipe?'. There is also a 'Category:' dropdown menu with 'Select a category' and an 'Upload a photo:' section with a 'Choose File' button and 'No file chosen' text. A red 'Save Recipe' button is at the bottom of the form. The website's header includes 'Home', 'Categories', 'Profile', and a search bar. The footer contains links for 'About Us', 'Contact Us', 'Privacy Policy', and 'Terms of Service', along with copyright information and social media icons.

figure 3.3.7 Create recipe page

The create recipe page is designed as a user-friendly form structure to be filled by the user of the details of recipes. There are several steps that the user needs to fill out to complete the creation recipe page. The user should begin by filling in the recipe name, the serving size, the cooking time, the list of the ingredients, and the procedures. For the category, the user can select categories from a dropdown menu to choose whether the recipe is suitable for breakfast, lunch, or dinner and upload the image optionally from the choose file button. The save button is crucial and encourages submission.

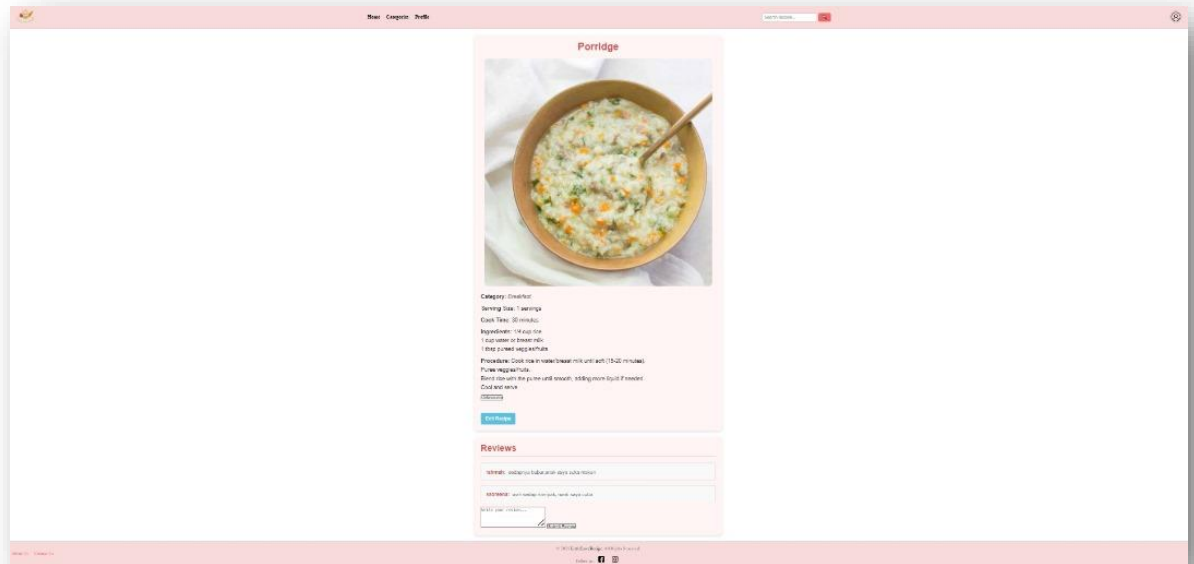

figure 3.3.8 Recipe page

The result of the recipe page will be displayed as above once the recipe has been created and saved successfully. The recipe page will also be displayed automatically on the categories page where it has been defined to which category. On top of the recipe page is the name of the recipe followed by the image and the information of the recipe. Below of the recipe information consisting of two buttons which are favourite and edit recipe buttons. If the user clicks on the favourite button, it will automatically turn to unfavourite. Favourite button is typically used to allow users to save or unsaved the recipe from a personalized collection for easy access later. The user can view all the favourite recipe collections as they will be saved on the profile and favourite page automatically. This button functions as otherwise for the unfavourite button. Besides that, the user can also edit the recipe page wherever they want to in the future for better improvement by clicking on the edit recipe button. On top of that, there is a review section underneath the recipe information that allows users to leave a review or comment regarding the recipe. To view the review, the user must click on the submit review button.

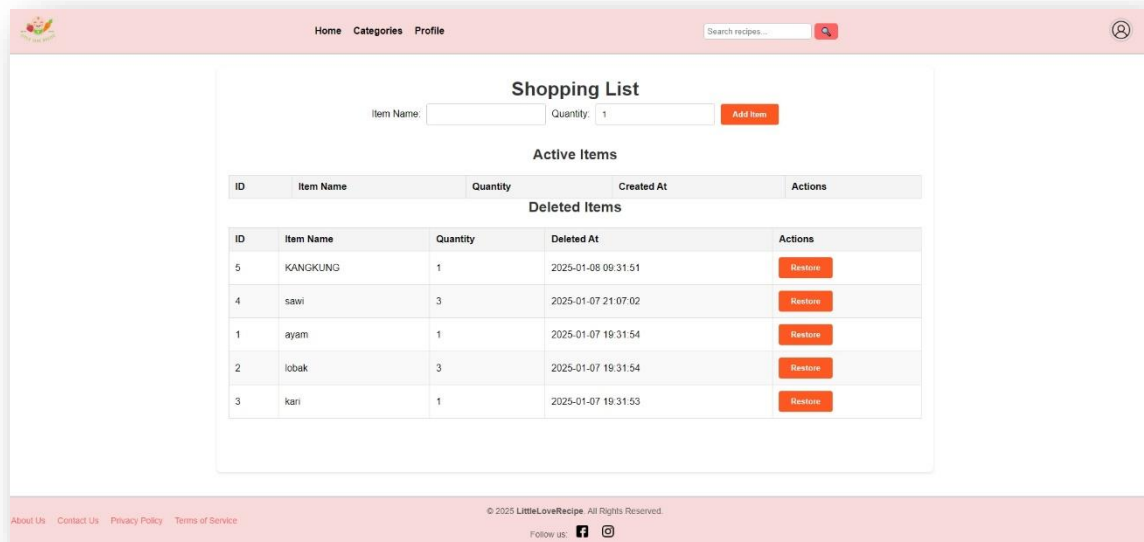

figure 3.3.9 Shopping list page

The shopping list page is designed for the user's personal use as it serves as a quick and easy way to jot down the item that needs to buy. This page is more likely to act as a personal note-taking tool that allows users to manage a personalized list of items they plan to purchase. However, it is not strictly tied to recipes but serves as a flexible notetaking for shopping needs due to its unlimited of specific types of items such as ingredients or any other household items. The users can add items including the quantity of the item by upgrading or downgrading the item and clicking the add item button to successfully save in the active items list. The active items table consists of the ID, the item name, the quantity, and the time created or added. The actions section works as a button to delete as the users can delete the item once it is not needed. The deleted item then will be displayed in the history of deleted item section. Those deleted items can also be restored in the active item list if the user wishes to buy the same items again for later use.

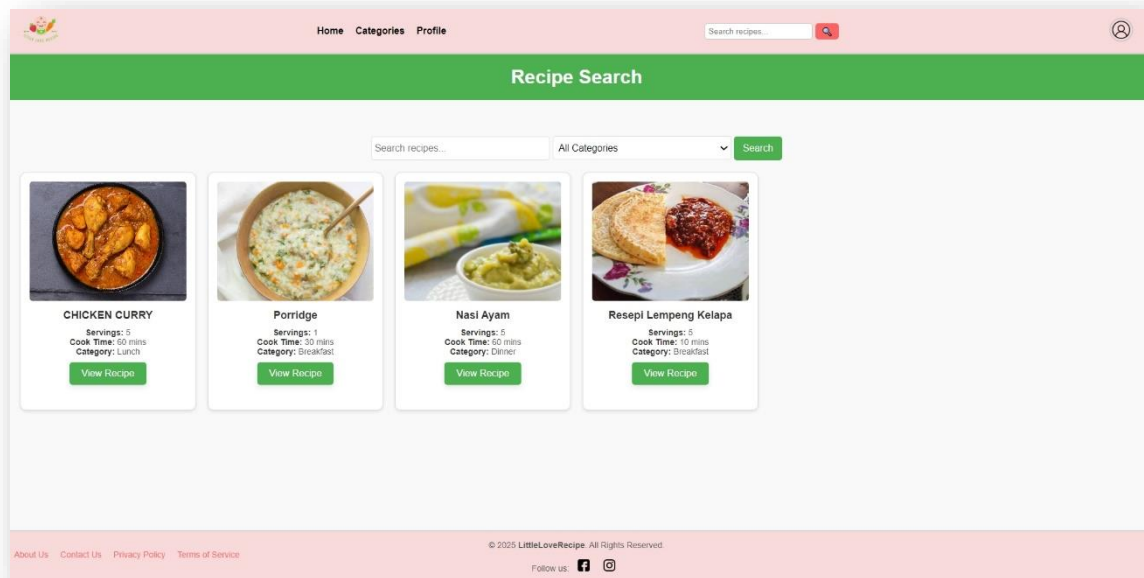

figure 3.3.10 Search recipe page

The search recipe page is one of the most important features of the web-based application. This page helps users browse any preference recipes that they would want. The users are required to type any keyword regarding the food on the search bar and click the search bar button. The result of the finding will appear as shown above. However, if the keyword searched is not available in the recipe collection, the message of no recipe found will be displayed. To enhance user convenience and accessibility, the users are encouraged to click on the dropdown menu that has been categorized into breakfast, lunch, and dinner. This method makes it easy for the user to cook their own meal that has been determined by the meal type. Once the user has found the preferred recipe, the user can click on the view recipe button that shows the complete recipe pages including the servings, the cook times, and the category information.

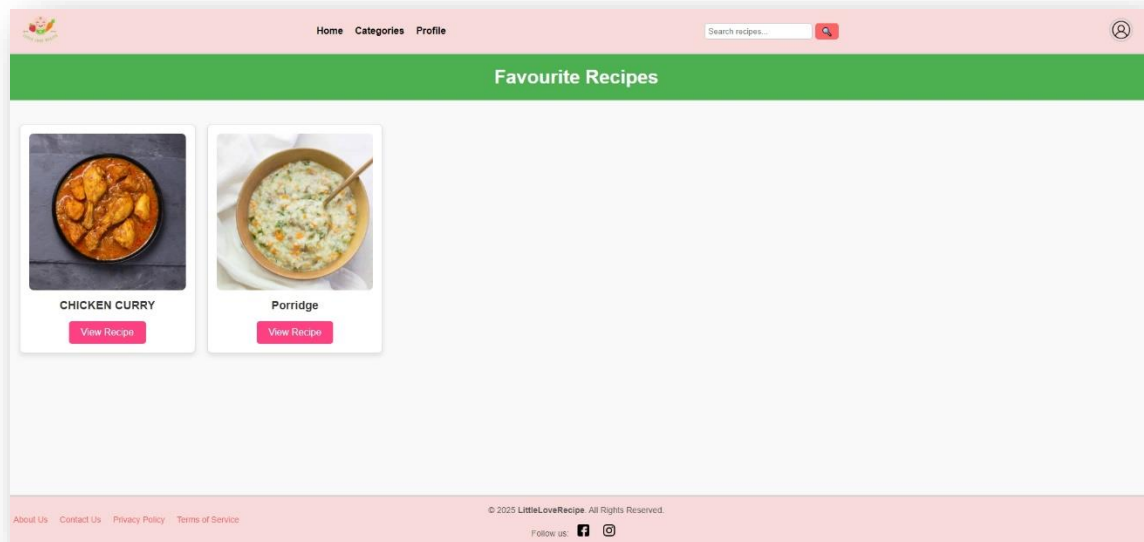

figure 3.3.11 Favourite recipe page

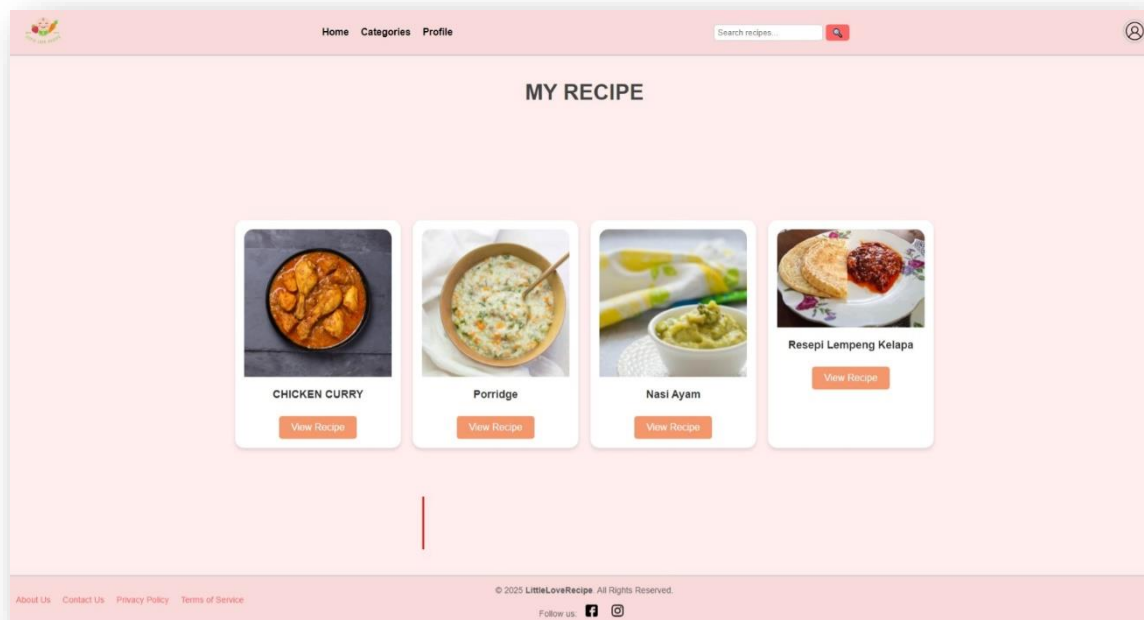

figure 3.3.12 My recipe page

Both favourite and my recipe pages are features that are displayed on the main home page and can be viewed on the profile page. These two pages primarily function as display and output pages after some actions such as save or add have been made.

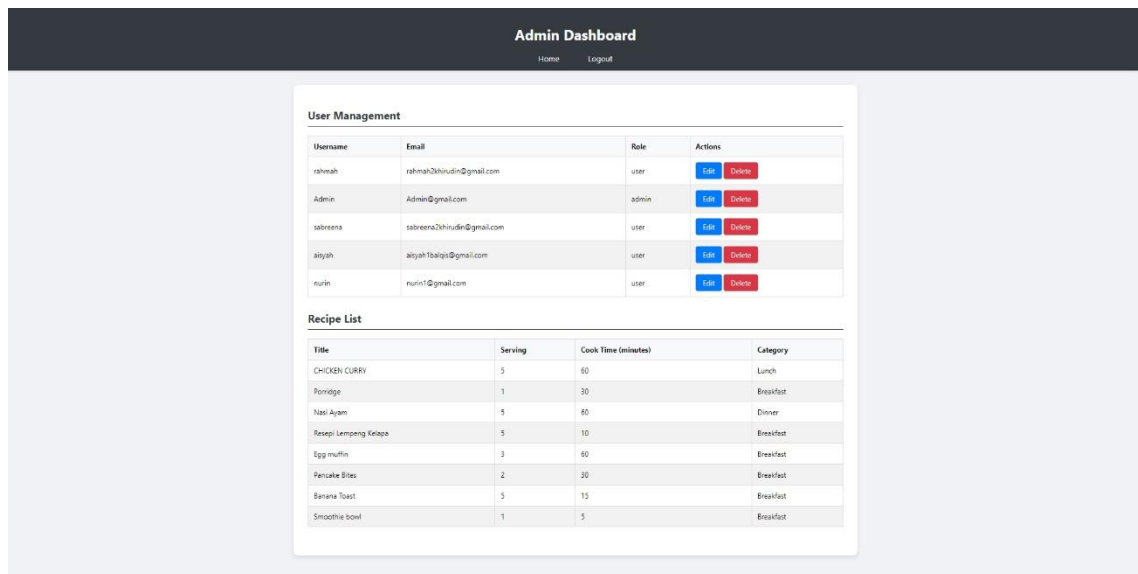

figure 3.3.13 Admin Dashboard

Lastly, the admin dashboard plays a crucial role as it contains all the data that have been input by the user. The admin dashboard is the main centralized control panel to manage the Little Love Recipe platform. There are two primary sections which are the user management and the recipe list. The user management section allows administrators to view all registered accounts by providing details of username, email address, role whether admin or user and actions such as editing user information or deleting account information if necessary. These actions are needed to ensure the platform remains organized. Meanwhile, the recipe list section allows a detailed overview of all recipes.

3.4 PROJECT FRAMEWORK/METHODOLOGY

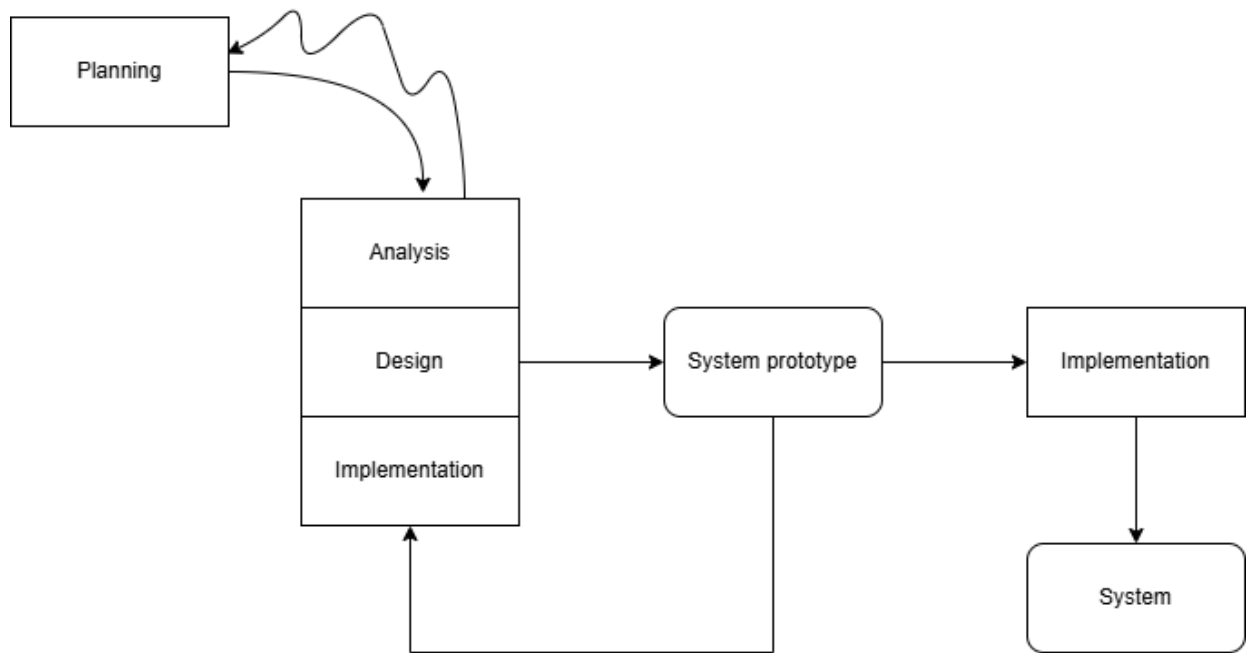

figure 3.4.1 Prototyping Methodology

For this project, we have selected a prototyping approach for the methodology. This iterative approach allows us to get a clear and early visualization and refinement of our web-based application. Prototyping methodology is the most suitable to be used for this project as it helps to reduce risks and ensure better alignment with user needs.

There are several phases of the prototyping approach to develop the Little Love Recipe. The beginning phase starts with planning the structure of the web-based application. The planning phase involves three significant steps to ensure effectiveness. The significant steps begin with outlining the goal, key features, and outcome which include deciding on the development tools. Little Love Recipe is specifically focused on creating a platform for busy parents with access to halal and nutrient-rich recipes for their children via web applications that can be accessed easily anywhere and anytime.

Secondly, during the Analysis phase, we gathered detailed requirements and feasibility by conducting market research to understand the competitors. By outlining the competitors with their strengths and weaknesses, we acknowledge the fragility of their systems and what should be improved. Moreover, we also conducted surveys to recognize the features that the user needs to implement in the web application.

Next, during the Design phase, some wireframes have been designed to get a clear overview of how the web application should be designed. These designs include the logo, color, typography, iconography, and the components that suit the platform.

Following the prototyping phase, we start developing the basic prototype using HTML, CSS, and JavaScript and ensuring each page is functioning thoroughly. Once the prototype is finalized, we move to the implementation phase. These two phases are considered crucial phases as we keep on improving the navigation, additional features, and adjustments in the design to enhance the look that aligns with user needs until the fully functional application is developed completely. At this phase, we need to integrate all features and test them on the local server of the usability issues to ensure that it is accessible to users. Finally, in the System Deployment phase, we launched the web application and focused on maintaining the web.

4.1 CONCLUSION

Little Love Recipe is a carefully designed web application aimed at empowering parents with access to halal and healthy recipes for their children. By bridging the gap between scattered social media posts and a comprehensive and customized recipe sharing platform, it addresses a critical need for new parents. This platform not only facilitates the discovery of interesting and nutritious recipes but also for recipe sharing, and reviews. With robust functions such as user management, recipe categorization, shopping list, favourite recipe, edit their own recipe and advanced search tools, Little Love Recipe ensures a smooth, safe and personalized experience for its users. Implementation of user data privacy, fast load times and intuitive navigation reflect the platform's dedication to high standards of usability. Ultimately, Little Love Recipe serves as a valuable resource for parents, creating a collaborative space to share culinary knowledge and improve children's nutrition.

4.2 FUTURE RECOMMENDATIONS

To make Little Love Recipe even more efficient, developers might work on a few things that improve not only the experience but also the general usefulness. By allowing customers to create their own weekly menus, they may implement an interactive meal planning tool that will help them become more efficient and well-organized. For parents who utilize this web program to save time while creating the menu, this might make life easier.

Furthermore, the experience may be improved by introducing more AI-powered features such as personalized recipe suggestions and component substitution recommendations, allowing users to find recipes that are tailored to their interests and available ingredients. It would be beneficial to have offline recipe access in this sense, enabling users to download recipes and use them whenever and wherever they choose, whether they have an internet connection.

Lastly, by enabling users to click ingredients directly from their shopping lists, these enhancements will not only help the culinary industry but also connect the application with online grocery delivery services. These modifications will thereby improve the application's usability and make it essential for working parents.
